Plugged Water Filters?

Hi SCOTT,

Did you know about the importance of 4FC filters in maintaining the performance of your Crysalli Beverage Systems water dispenser?

4FC Filters are high TOC capacity, submicron, 3-stage filters that utilize fibredyne technology to ensure the best water quality possible. They play a crucial role in removing contaminants and particles as small as 0.5 micron from the water.

In order for these filters to perform optimally, it is essential to replace them periodically. The frequency of filter changes depends on your water quality and usage. Be sure to replace your filters when you notice:

- A drop in flow rate from the still side faucet
- Loud pump noise from the sparkling side faucet
- An unusual taste in the water

Remember, plugging indicates that the cartridges are working efficiently. If a cartridge plugs soon after installation, various factors such as construction in your area or changes in reservoir levels may alter the quality of your incoming water. This can produce low water pressure or excessive turbidity (a large number of particles) in your water, causing the cartridges to plug prematurely.
